7.2 Opportunities for Further Analysis 26
7.3 Conclusion 26

1. Executive Summary

This report evaluates Apex Manufacturing's sales performance, product contribution, regional sales distribution and customer purchasing patterns. The analysis draws on 20 sales transactions to identify performance trends, customer concentration and opportunities for management action.

The dataset records total net sales revenue of **€25,361**, representing **4,605 units sold**, with total discounts of **€764**.

Safety Valve generated the highest net sales revenue at €10,625, followed by Pipe Connector (€8,756) and Steel Bolt (€5,980). Regionally, the East recorded the highest net sales revenue (€7,975), while the North generated the lowest (€4,792).

Monthly net sales revenue declined from €6,740 in January to €4,729 in April, representing a decrease of approximately **29.84%** between those months. May's recorded revenue of €2,562 covers only part of the month and is therefore not directly comparable with complete months.

Customer analysis identified a concentration in Steel Bolt purchases, with Retailer A accounting for **42.81% of the product's 2,990 units sold**. This suggests potential exposure to changes in the purchasing behaviour of a major customer.

The findings support three management priorities:

1. **Investigate declining monthly sales:** Examine whether the January–April reduction reflects changes in customer demand, transaction volume, product mix or other factors.
2. **Strengthen regional and product performance:** Assess opportunities to improve sales in lower-performing regions while maintaining the contribution of leading products.
3. **Monitor customer concentration:** Track reliance on major customers and evaluate opportunities to diversify the customer base.

These recommendations are exploratory. The small, simulated dataset does not establish the underlying causes of sales changes or the financial returns from potential interventions.

2. Project Background and Objectives

2.1 Project Background

Apex Manufacturing is a fictional manufacturing business used for this data analytics portfolio project. The company sells three products: Steel Bolt, Safety Valve and Pipe Connector.

This project examines the company's sales performance using a simulated dataset containing 20 sales transactions recorded between January and May 2026.

Microsoft Power BI was used to transform the dataset into interactive dashboards, enabling the examination of revenue performance, product contributions, regional sales distribution and customer purchasing patterns.

The analysis is intended to support evidence-based business decision-making by identifying important sales trends, areas requiring further investigation and potential opportunities for improvement.

2.2 Project Aim

The primary aim of this project is to evaluate Apex Manufacturing's sales performance and customer purchasing patterns using Microsoft Power BI, and to translate the findings into actionable business recommendations.

2.3 Project Objectives

The specific objectives are to:

1. Evaluate overall sales performance using key performance indicators, including net sales revenue, units sold and discounts.
2. Compare the revenue contributions of different products to identify leading and lower-performing products.
3. Examine regional sales performance to identify geographical differences in revenue generation.
4. Analyse monthly sales trends to identify changes in revenue over the reporting period.
5. Assess customer purchasing patterns and identify potential customer concentration risks.
6. Develop interactive Power BI dashboards to communicate findings clearly to business stakeholders.
7. Recommend potential management actions based on the analytical findings.

2.4 Key Business Questions

The analysis seeks to answer the following questions:

- How much net sales revenue did Apex Manufacturing generate during the reporting period?
- Which products contributed the most and least to total net sales revenue?
- Which regions recorded the strongest and weakest sales performance?
- How did monthly net sales revenue change between January and May 2026?
- Which customers purchased the greatest quantities of Steel Bolt?
- To what extent is Steel Bolt sales volume concentrated among individual customers?
- What actions could management consider to improve sales performance and manage customer concentration?

Answering these questions provides a structured basis for interpreting the Power BI dashboards and developing management recommendations.

3. Data Preparation and Methodology

3.1 Data Source and Description

The analysis was conducted using a simulated sales dataset for Apex Manufacturing, covering January to May 2026.

The dataset contains 20 sales transactions and 13 columns, representing information about product sales, customers, geographical regions, quantities, discounts and order statuses.

The dataset was imported into Microsoft Power BI Desktop for data preparation, modelling, analysis and visualisation.

3.2 Data Cleaning and Transformation

Power Query Editor was used to inspect and prepare the dataset before analysis.

During data-quality checks, two inconsistencies were identified:

Product Name Inconsistency

The product *Steel Bolt* appeared in two formats: "Steel Bolt" and "steel bolt".

Although these values referred to the same product, inconsistent naming could lead to inaccurate product grouping and reporting.

The values were standardised to "Steel Bolt" using Power Query's Replace Values functionality. The Product column was subsequently checked to confirm that only three distinct products remained:

- Steel Bolt
- Safety Valve
- Pipe Connector

Order Status Inconsistency

The order status field contained both "Complete" and "Completed".

These values were standardised to "Completed" to ensure consistent categorisation of completed orders.

Following these transformations, the cleaned dataset was applied to the Power BI data model.

3.3 Data Validation

After the data-cleaning process, the key performance indicators were checked against their previously established values.

The following results remained unchanged:

Key Performance Indicator	Validated Value
Total Net Sales Revenue	€25,361
Total Units Sold	4,605
Total Discounts	€764

This validation confirmed that the text standardisation steps did not alter the reported aggregate sales figures.

3.4 Data Analysis Using DAX

Data Analysis Expressions (DAX) measures were used to calculate and present key performance indicators.

The analysis included measures for net sales revenue, total units sold, total discounts and customer sales concentration.

A customer-share measure was used to calculate the proportion of units sold to each customer within the current filter context.

The following measure was created to identify the largest customer share:

```
Largest Customer Share % =

MAXX(

   VALUES('Cleaned_Data'[Customer]),

   [Steel Bolt Customer Share %]

)
```

The measure evaluates customer shares and returns the highest percentage for the selected data.

When the report was filtered to Steel Bolt, the measure returned 42.81%, representing Retailer A's share of Steel Bolt units sold.

3.5 Dashboard Development

Two analytical report pages were developed in Power BI.

Sales Performance Dashboard

The Sales Performance page presents an overview of the company's sales performance through:

- KPI cards displaying net sales revenue, total units sold and total discounts.
- A line chart illustrating monthly net sales revenue.
- Bar charts comparing product and regional sales performance.

- Interactive slicers supporting analysis by selected dimensions.

Customer Sales Analysis Dashboard

The Customer Sales Analysis page focuses on customer purchasing patterns and sales concentration.

It includes:

- A bar chart comparing units sold by customer.
- A table displaying customer-level sales volumes and percentage shares.
- A KPI card identifying the largest customer share.
- A business insight explaining the potential management implications of customer concentration.

3.6 Analytical Approach

The project employed descriptive analysis to summarise historical sales performance and compare results across products, regions, months and customers.

The analysis also incorporated diagnostic questions to identify areas requiring further investigation, particularly declining monthly revenue and customer concentration.

However, the available dataset does not establish the underlying causes of observed sales patterns. Recommendations are therefore presented as potential management actions rather than proven solutions.

4. Sales Performance Analysis

4.1 Overall Sales Performance

Apex Manufacturing recorded total net sales revenue of **€25,361** from **4,605 units sold** during the reporting period of January–May 2026. Total recorded discounts amounted to **€764**.

These key performance indicators provide an overview of the company's sales activity and establish a basis for evaluating performance across products, regions and reporting months.

The average net sales revenue per unit was approximately €5.51, calculated as:

€25,361 ÷ 4,605 = €5.51 per unit.

This represents the average revenue generated per unit sold across the product portfolio, rather than the average selling price of any individual product.

Although the overall figures summarise sales activity, they do not independently establish profitability. A reliable profitability assessment would require additional information on production costs, operating expenses and other relevant costs.

4.2 Product Sales Performance

The analysis identified differences in the revenue contributions of Apex Manufacturing's three products.

Product	Net Sales Revenue	Share of Total Revenue
Safety Valve	€10,625	41.90%
Pipe Connector	€8,756	34.53%
Steel Bolt	€5,980	23.58%
Total	**€25,361**	**100.00%**

Percentages are individually rounded to two decimal places.

Safety Valve generated the highest net sales revenue at €10,625, representing approximately 41.90% of total revenue.

Pipe Connector was the second-largest contributor, generating €8,756, equivalent to 34.53% of total revenue.

Steel Bolt generated the lowest revenue contribution at €5,980, representing approximately 23.58%.

Together, Safety Valve and Pipe Connector accounted for approximately 76.42% of total net sales revenue.

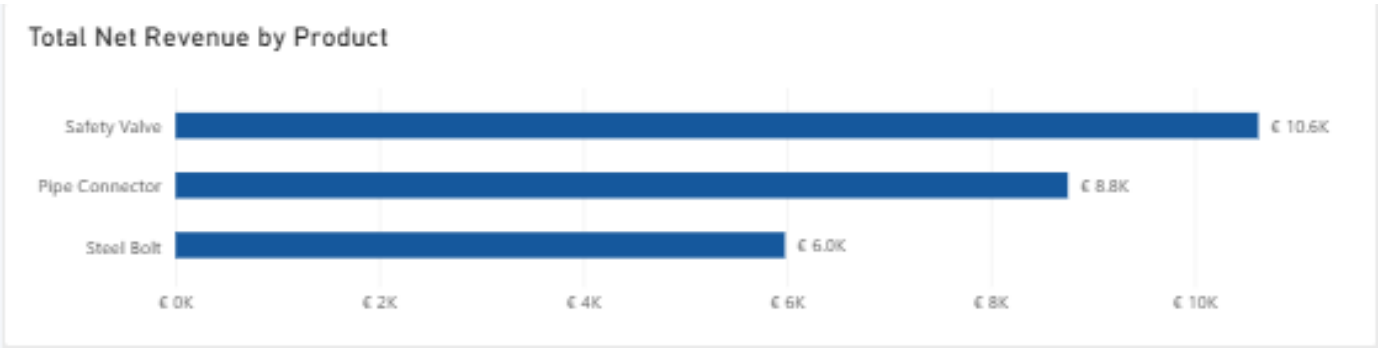

Figure 1: Net Sales Revenue by Product, January–May 2026

Business Interpretation

The results indicate that Apex Manufacturing's revenue is concentrated primarily in Safety Valve and Pipe Connector.

However, Steel Bolt's lower revenue contribution does not necessarily indicate poor performance. Revenue differences may reflect variations in selling prices, quantities sold or product mix.

Management should therefore examine product-level unit sales, pricing and profitability before determining whether any product requires corrective action.

4.3 Regional Sales Performance

Regional analysis revealed differences in revenue generation across Apex Manufacturing's four sales regions.

Region	Net Sales Revenue	Share of Total Revenue
East	€7,975	31.45%
West	€6,304	24.86%
South	€6,290	24.80%
North	€4,792	18.90%
Total	**€25,361**	**100.00%**

Percentages are individually rounded to two decimal places.

The East region generated the highest net sales revenue at €7,975, accounting for approximately 31.45% of total revenue.

The West and South regions recorded similar performance, generating €6,304 and €6,290 respectively.

The North region generated the lowest net sales revenue at €4,792, representing approximately 18.90% of total revenue.

The difference between the highest-performing region (East) and the lowest-performing region (North) was €3,183.

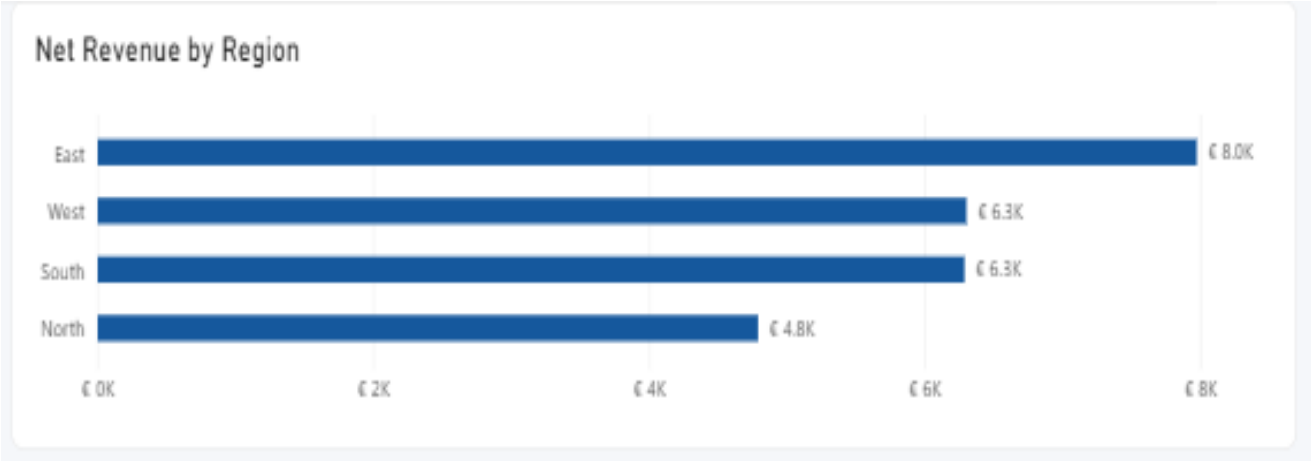

Figure 2: Net Sales Revenue by Region, January–May 2026

Business Interpretation

The regional results suggest that sales activity is unevenly distributed across the company's geographical markets.

Although the East region contributed the greatest revenue, this does not necessarily establish that it is the most profitable or operationally efficient region.

Similarly, the North's lower revenue could reflect differences in market size, customer numbers, product availability or sales activity.

Management should investigate these factors before deciding whether to increase marketing expenditure, adjust distribution arrangements or introduce region-specific sales initiatives.

4.4 Monthly Sales Revenue Trends

Monthly sales analysis identified a downward trend in recorded net sales revenue between January and April 2026.

Month	Net Sales Revenue
January	€6,740
February	€5,932
March	€5,398
April	€4,729
May (Partial Month)	€2,562

Revenue declined from €6,740 in January to €4,729 in April.

The percentage change between January and April was calculated as follows:

Percentage change = ((€4,729 − €6,740) ÷ €6,740) × 100

= **−29.84%**

This represents an approximately 29.84% reduction in monthly net sales revenue between January and April 2026.

May recorded €2,562 in revenue; however, the available data covers only part of the month. Consequently, May's figure should not be directly compared with complete months when evaluating monthly performance.

Monthly Net Sales Revenue, January–May 2026 (May Partial)

Business Interpretation

The January–April decline is a notable finding that warrants management attention.

However, the available data does not establish whether the decline resulted from reduced customer demand, fewer transactions, changes in product mix, pricing decisions or other factors.

Further analysis of transaction frequency, unit sales, customer purchasing behaviour and product-level revenue trends would help determine which factors contributed to the reduction.

4.5 Summary of Sales Performance Findings

The sales performance analysis identified four principal findings:

1. Apex Manufacturing generated €25,361 in net sales revenue from 4,605 units sold during the reporting period.
2. Safety Valve was the largest revenue contributor, accounting for approximately 41.90% of total revenue.
3. The East region generated the highest revenue, while the North recorded the lowest.
4. Monthly revenue declined by approximately 29.84% between January and April 2026, although the causes of this decline remain unconfirmed.

These findings highlight the importance of monitoring sales trends, evaluating product contributions and investigating regional performance differences.

They also provide a foundation for developing targeted management recommendations based on further analysis.

5. Customer Analysis

5.1 Overview of Customer Purchasing Patterns

Customer analysis was conducted to evaluate purchasing patterns and identify potential customer concentration within Apex Manufacturing's Steel Bolt product category.

The analysis examined units purchased by four retailers using Power BI visualisations and DAX measures.

During the reporting period, Steel Bolt recorded a total of **2,990 units sold**, distributed among Retailers A, B, C and D.

The analysis focused on the distribution of unit sales rather than customer profitability or the total monetary value of individual customer relationships.

5.2 Steel Bolt Sales Distribution by Customer

The distribution of Steel Bolt unit sales is presented below.

Customer	Units Purchased	Share of Steel Bolt Units
Retailer A	1,280	42.81%
Retailer B	680	22.74%
Retailer C	350	11.71%
Retailer D	680	22.74%
Total	**2,990**	**100.00%**

Retailer A purchased the largest quantity of Steel Bolt, accounting for approximately 42.81% of total units sold.

Retailers B and D each purchased 680 units, representing approximately 22.74% of Steel Bolt sales volume per retailer.

Retailer C recorded the lowest purchasing volume, with 350 units, equivalent to approximately 11.71%.

The findings indicate that Steel Bolt sales volume is not evenly distributed among the four customers.

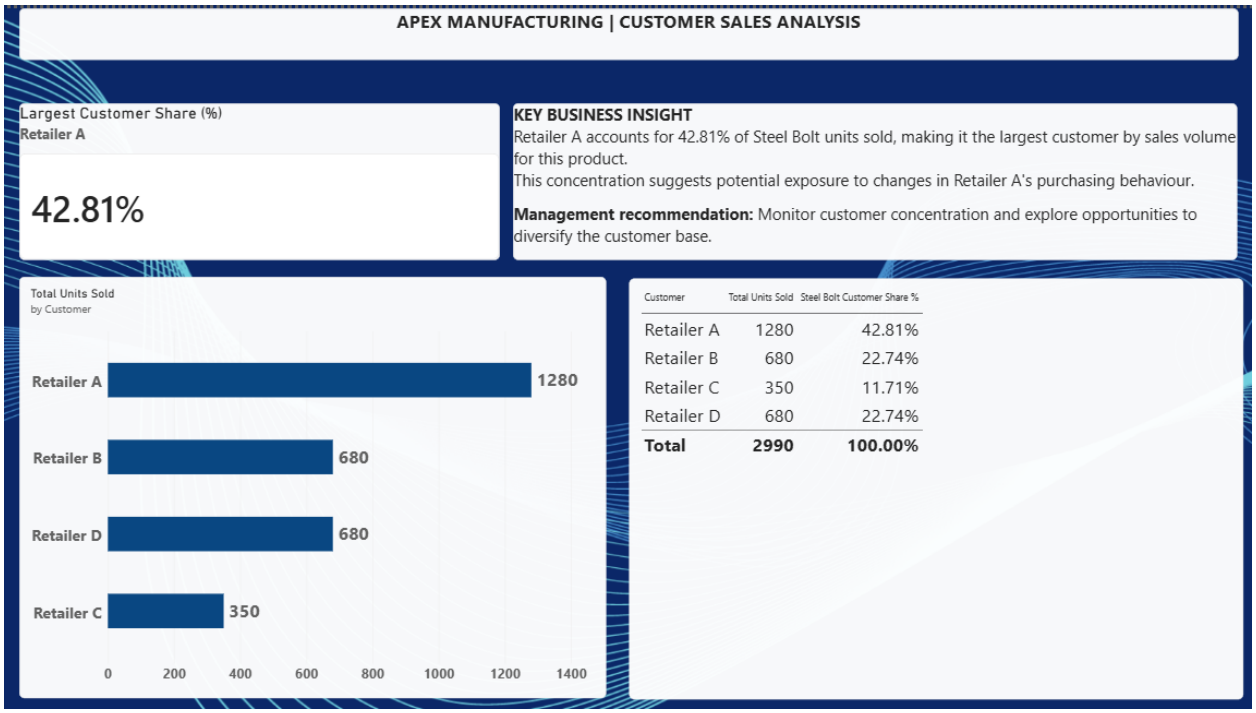

Figure 4: Apex Manufacturing Customer Sales Analysis Dashboard. Steel Bolt Unit Sales Distribution, January–May 2026

5.3 Customer Concentration Analysis

Customer concentration refers to the extent to which a business relies on a limited number of customers for its sales.

The analysis identified Retailer A as the largest purchaser of Steel Bolt, accounting for 42.81% of the product's total unit sales.

The combined share of Retailers A and B was approximately 65.55%, meaning that nearly two-thirds of Steel Bolt units were purchased by these two retailers.

This concentration suggests that changes in the purchasing behaviour of a small number of customers could materially affect Steel Bolt sales volume.

For example, a reduction in Retailer A's purchasing activity could significantly influence overall Steel Bolt demand if other customers did not compensate for the reduction.

However, the analysis does not establish that Retailer A is reducing purchases or that the existing concentration has already caused financial difficulties.

Furthermore, unit-sales concentration does not necessarily correspond to revenue or profit concentration, as customer-specific pricing, discounts and costs may differ.

5.4 Business Implications

The findings have several implications for Apex Manufacturing's customer management strategy.

Customer Relationship Management

Retailer A represents an important customer for Steel Bolt sales volume. Maintaining a strong commercial relationship with this retailer could support continuity in product demand.

Customer Diversification

The company could investigate opportunities to increase purchasing volumes among existing smaller customers and attract additional buyers.

However, diversification initiatives should be assessed against their expected costs and commercial benefits.

Sales Monitoring

Management could monitor customer-level purchasing volumes over time to identify changes in ordering behaviour.

This would help distinguish normal fluctuations from sustained reductions in customer demand.

Customer Profitability

Although Retailer A purchases the greatest number of Steel Bolt units, the available analysis does not establish whether it is the most profitable customer.

A customer profitability assessment would require additional information on selling prices, discounts, fulfilment costs and other customer-specific expenses.

5.5 Customer Analysis Recommendations

Based on the findings, the following actions are recommended for management consideration:

1. **Monitor customer concentration:** Track the proportion of Steel Bolt sales attributable to major customers over time.
2. **Strengthen key customer relationships:** Maintain regular engagement with high-volume customers to better understand their purchasing requirements.
3. **Explore customer diversification:** Evaluate opportunities to expand the customer base and reduce excessive reliance on individual purchasers.
4. **Investigate customer profitability:** Examine customer-level revenue and costs before prioritising commercial initiatives.
5. **Develop customer performance indicators:** Introduce measures such as customer retention, purchasing frequency and average purchase volume to support ongoing analysis.

5.6 Summary of Customer Analysis

The analysis identified Retailer A as the largest purchaser of Steel Bolt, accounting for 42.81% of the product's total unit sales.

This finding highlights a potential customer concentration risk that management should monitor.

However, the available data does not demonstrate that customer concentration has caused declining revenue or reduced profitability.

The results therefore support further investigation and ongoing customer performance monitoring rather than immediate conclusions about the company's financial exposure.

6. Business Recommendations

6.1 Overview

The sales and customer analysis identified three areas requiring management attention: declining monthly revenue, differences in regional and product performance, and customer concentration within Steel Bolt sales.

Based on these findings, this section proposes five recommendations designed to support sales performance monitoring, customer relationship management and evidence-based commercial decisions.

The recommendations are informed by the descriptive analysis of Apex Manufacturing's simulated sales dataset. Their effectiveness would require further investigation and evaluation before implementation.

6.2 Recommendation 1: Investigate and Address Declining Monthly Revenue

Analytical Finding

Net sales revenue declined from €6,740 in January to €4,729 in April 2026, representing a reduction of approximately 29.84%.

Recommended Action

Management should conduct a more detailed investigation into the factors contributing to the decline.

This investigation should examine monthly transaction volumes, quantities sold, product mix, customer purchasing frequency and changes in average selling prices.

The findings could then inform targeted actions to address the specific factors identified.

Proposed Performance Indicators

- Monthly net sales revenue.
- Month-on-month revenue growth rate.
- Number of sales transactions.
- Average transaction value.
- Units sold per month.

Expected Business Benefit

A more detailed understanding of the revenue decline would enable management to distinguish between changes in sales volume, pricing and product mix, supporting better-targeted commercial decisions.

6.3 Recommendation 2: Strengthen Performance in Lower-Revenue Regions

Analytical Finding

The East region generated the highest net sales revenue at €7,975, while the North recorded the lowest at €4,792.

The difference between the two regions was €3,183.

Recommended Action

Management should investigate the commercial factors contributing to the North region's lower revenue.

The assessment should consider customer numbers, transaction frequency, product availability, distribution coverage and regional market opportunities.

Where justified by the findings, management could test targeted sales initiatives or distribution improvements.

Proposed Performance Indicators

- Monthly revenue by region.
- Revenue growth rate by region.
- Number of active customers by region.
- Average revenue per customer.
- Sales revenue relative to regional marketing expenditure.

Expected Business Benefit

A region-specific approach could help identify commercially viable growth opportunities while avoiding unnecessary expenditure in markets where demand or capacity is limited.

6.4 Recommendation 3: Manage Customer Concentration Risk

Analytical Finding

Retailer A accounted for 42.81% of Steel Bolt units sold during the reporting period.

Retailers A and B together represented approximately 65.55% of Steel Bolt sales volume.

Recommended Action

Management should monitor customer concentration and assess opportunities to diversify Steel Bolt sales across a broader customer base.

At the same time, the company should maintain effective relationships with existing high-volume customers.

Diversification efforts could include developing relationships with additional retailers or increasing purchasing activity among existing smaller customers.

Proposed Performance Indicators

- Largest customer share of total product units sold.
- Number of active customers.
- New customers acquired.
- Average purchase volume per customer.
- Customer retention rate.

Expected Business Benefit

Monitoring customer concentration would help management understand exposure to individual customers and evaluate whether diversification initiatives are improving the distribution of sales.

However, reducing concentration should not be treated as an objective in isolation. Management should also consider the profitability and commercial value of individual customer relationships.

6.5 Recommendation 4: Evaluate Product Performance Beyond Revenue

Analytical Finding

Safety Valve generated the highest net sales revenue at €10,625, representing approximately 41.90% of total revenue.

Steel Bolt generated the lowest revenue at €5,980, accounting for approximately 23.58%.

Recommended Action

Management should evaluate product performance using additional measures beyond total revenue.

These should include unit sales, average selling price, production costs, gross profit and gross profit margin.

The company could then identify which products contribute most effectively to financial performance and determine whether adjustments to pricing, production or marketing strategies are justified.

Proposed Performance Indicators

- Net sales revenue by product.
- Units sold by product.
- Average net selling price per unit.
- Gross profit by product.
- Gross profit margin by product.

Expected Business Benefit

A broader performance assessment would enable management to distinguish high-revenue products from high-profit products and make more informed decisions about resource allocation.

6.6 Recommendation 5: Introduce Continuous Performance Monitoring

Analytical Finding

The analysis demonstrated that interactive Power BI dashboards can consolidate sales information and highlight differences across products, regions, months and customers.

Recommended Action

Apex Manufacturing should consider adopting a structured sales performance monitoring process using regularly updated Power BI reports.

Management could review key performance indicators monthly and investigate significant deviations from expected performance.

Where additional data becomes available, the dashboards could be expanded to incorporate customer retention, acquisition costs, product profitability and sales targets.

Proposed Performance Indicators

- Monthly revenue growth.
- Revenue performance against targets.
- Product-level gross profit margin.
- Customer retention and acquisition.
- Customer concentration.

- Regional revenue growth.

Expected Business Benefit

A consistent reporting process could improve visibility of commercial performance, support earlier identification of emerging issues and encourage more evidence-based management decisions.

6.7 Recommended Implementation Priorities

The proposed actions can be organised into the following implementation framework.

Priority	Management Action	Suggested Timeline	Measure of Success
High	Investigate monthly revenue decline	First 30 days	Documented analysis of revenue drivers
High	Monitor major customer concentration	First 30 days	Customer concentration KPI reviewed monthly
Medium	Assess lower-revenue regions	30–60 days	Regional performance assessment completed
Medium	Evaluate product profitability	30–60 days	Product-level margin analysis established
Medium	Introduce regular dashboard reviews	30–90 days	Monthly KPI reporting process implemented

The timelines are proposed planning estimates rather than commitments or outcomes established by the dataset.

6.8 Evaluating the Effectiveness of Recommendations

Management should assess the effectiveness of any implemented initiatives using measurable performance indicators.

For example, a customer acquisition campaign could be evaluated by comparing the number of new customers, their purchasing activity and the incremental gross profit generated against the campaign's costs.

Similarly, regional sales initiatives could be assessed using changes in revenue, transaction volumes and customer acquisition, while accounting for relevant costs and market conditions.

Where practical, management should compare outcomes against an appropriate baseline or comparison group to avoid attributing every observed change to a particular intervention.

This approach would support more reliable evaluation of commercial initiatives and help management prioritise actions that deliver measurable business value.

7. Limitations and Conclusion

7.1 Limitations of the Analysis

Although the analysis provides useful insights into Apex Manufacturing's sales performance and customer purchasing patterns, several limitations should be considered when interpreting the findings.

1. Limited Dataset Size

The analysis was based on a simulated dataset containing 20 sales transactions. This relatively small sample limits the extent to which the findings can be generalised to a larger manufacturing business.

Consequently, the observed patterns should be interpreted as findings from the available dataset rather than conclusive evidence of long-term business performance.

2. Restricted Reporting Period

The dataset covers January to May 2026, with May representing only a partial reporting month.

Although net sales revenue declined between January and April, the available reporting period is insufficient to establish whether this represents a sustained long-term trend or a seasonal pattern.

A longer reporting period would support more reliable trend analysis and year-on-year comparisons.

3. Absence of Cost and Profitability Data

The analysis focused primarily on sales revenue, quantities sold and discounts.

Without detailed production costs, operating expenses and customer servicing costs, it was not possible to evaluate product profitability, customer profitability or overall business margins.

As a result, products generating higher revenue cannot automatically be classified as the most profitable.

4. Limited Customer Behaviour Data

The customer analysis identified differences in Steel Bolt purchasing volumes and highlighted customer concentration.

However, the dataset did not provide sufficient historical information to evaluate customer retention, customer lifetime value or changes in purchasing behaviour over an extended period.

The analysis therefore identifies potential customer concentration exposure rather than confirmed customer attrition or financial risk.

5. Limitations of Descriptive Analysis

The project primarily employed descriptive analytics to summarise and compare sales performance.

Although the dashboards identified revenue changes and differences across products, regions and customers, the analysis did not establish the underlying causes of these patterns.

Further diagnostic analysis, supported by additional business and market information, would be necessary before attributing the findings to specific commercial or operational factors.

7.2 Opportunities for Further Analysis

Future analysis could be strengthened by expanding the dataset and incorporating additional performance indicators.

Potential improvements include:

- Collecting sales data over multiple years to support seasonal and year-on-year comparisons.
- Incorporating production and operating costs to assess product profitability.
- Tracking customer purchasing behaviour over time to evaluate retention and customer lifetime value.
- Analysing transaction frequency, average order value and product-level pricing.
- Introducing sales targets and budget information to measure performance against expectations.
- Evaluating the financial effectiveness of marketing and customer acquisition initiatives.

These improvements would enable a more comprehensive assessment of Apex Manufacturing's commercial performance.

7.3 Conclusion

This project evaluated Apex Manufacturing's sales performance and customer purchasing patterns using Microsoft Power BI.

The analysis identified total net sales revenue of **€25,361**, representing **4,605 units sold**, with recorded discounts of **€764** during January–May 2026.

Safety Valve generated the highest net sales revenue at €10,625, while Steel Bolt contributed the lowest at €5,980.

Regional analysis identified the East as the highest-revenue region and the North as the lowest.

Monthly revenue declined by approximately 29.84% between January and April 2026, highlighting a performance pattern requiring further investigation.

Customer analysis also identified a concentration in Steel Bolt sales, with Retailer A accounting for 42.81% of the product's total unit sales.

Based on these findings, the report recommended further investigation into declining monthly revenue, closer monitoring of customer concentration, regional performance assessment, product profitability analysis and regular performance reporting.

Importantly, the findings should be interpreted within the limitations of the simulated dataset. The analysis does not establish the causes of declining revenue or demonstrate that the recommended interventions would necessarily improve financial performance.

Overall, the project demonstrates how data cleaning, DAX calculations, interactive Power BI dashboards and business analysis can be combined to transform transactional data into meaningful management information.

It also illustrates the importance of communicating analytical findings clearly, recognising data limitations and developing recommendations grounded in available evidence.
