Apex Manufacturing | Sales Performance & Customer Analytics

Project Type: End-to-End Business Intelligence Portfolio Project
Tools: Microsoft Power BI, Power Query, DAX, Microsoft Excel
Dataset: Simulated Manufacturing Sales Data
Reporting Period: January–May 2026

Project Overview

Developed an interactive Power BI reporting solution to analyse sales performance, product contributions, regional revenue distribution and customer purchasing patterns for a fictional manufacturing company.

The project involved data cleaning, KPI development, dashboard design and the translation of analytical findings into actionable business recommendations.

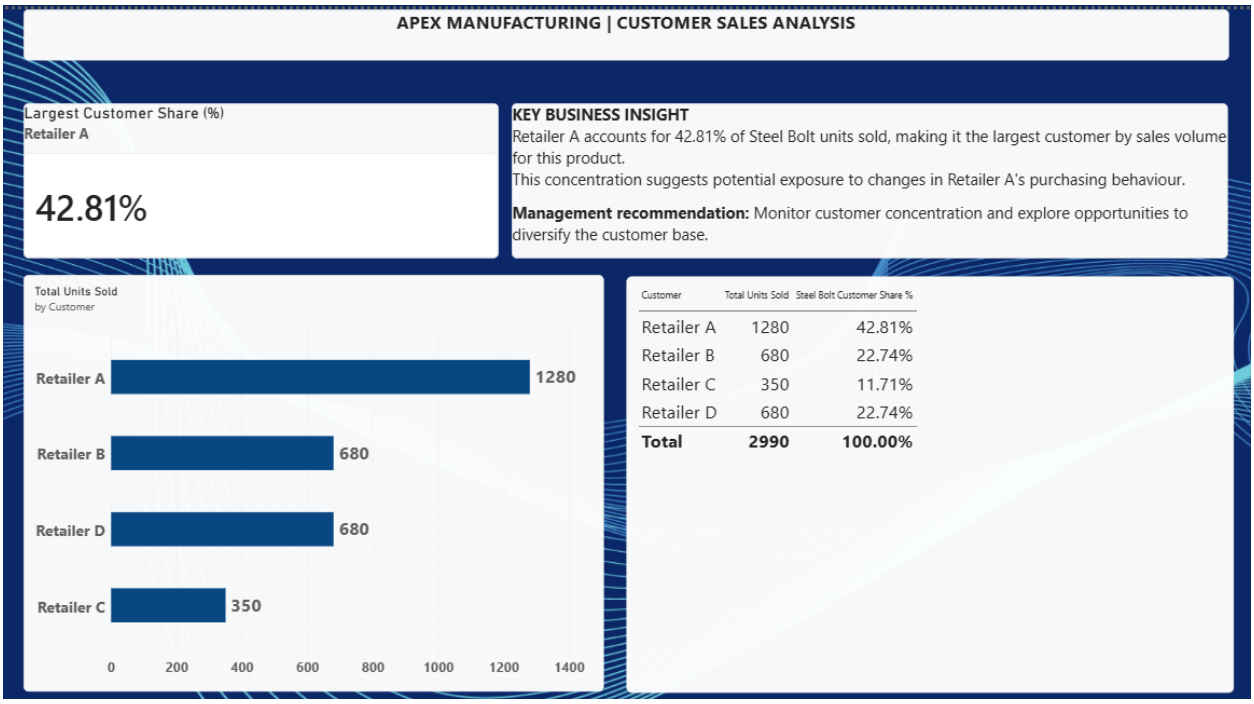

Figure 1: Apex Manufacturing Sales Performance Dashboard (January–May 2026).

Business Problem

Apex Manufacturing required a clearer understanding of its sales performance across products, regions and customers.

The analysis sought to identify revenue trends, differences in product and regional performance, and potential customer concentration risks.

My Approach

1. **Data Preparation:** Used Power Query to clean and standardise inconsistent product names and order statuses.
2. **Data Analysis:** Developed DAX measures to calculate key sales indicators and customer concentration.
3. **Data Visualisation:** Created two interactive Power BI dashboard pages covering sales performance and customer purchasing patterns.
4. **Business Interpretation:** Analysed revenue trends, product and regional contributions, and customer purchasing distribution.
5. **Management Reporting:** Produced a structured report with evidence-based findings, recommendations and implementation priorities.

Key Findings

- **€25,361** in total net sales revenue from **4,605 units sold**.
- **Safety Valve** contributed the highest product revenue at **€10,625 (41.90%)**.
- The **East region** generated the highest regional revenue at **€7,975**.
- Monthly revenue declined by approximately **29.84% between January and April 2026**.
- **Retailer A accounted for 42.81% of Steel Bolt unit sales**, highlighting potential customer concentration exposure.

Business Recommendations

Recommended investigating the monthly revenue decline, assessing lower-revenue regions, monitoring customer concentration, evaluating product profitability and introducing regular KPI reviews.

Skills Demonstrated

Technical: Power BI, Power Query, DAX, data cleaning, KPI development, dashboard design and data validation.

Analytical: Descriptive analytics, trend analysis, customer concentration analysis, business problem-solving and performance evaluation.

Communication: Data storytelling, management reporting and evidence-based business recommendations.

Project Limitations

The project uses a small, simulated dataset containing 20 transactions. Findings demonstrate analytical methods and reporting capabilities rather than verified outcomes for a real manufacturing company.

For a detailed analysis of sales performance, customer purchasing patterns and management recommendations, see the accompanying Apex Manufacturing Management Report.
